

MODERN RAILWAY TRACK

Coenraad Esveld

TABLE OF CONTENTS		PAGE
1.	INTRODUCTION	1
2.	RAIL GUIDANCE PRINCIPLE	5
2.1	Basic principles	5
2.2	Wheelset and track dimensions	6
2.3	Conicity	7
2.4	Lateral movements of a wheelset on straight track	8
2.4.1	Theory according to Klingel	8
2.4.2	Hunting movement	10
2.4.3	Worn wheel profiles	11
3.	CURVES AND GRADIENTS	13
3.1	General considerations	13
3.2	Curvature and superelevation in horizontal curves	13
3.2.1	Curve radius/curvature	13
3.2.2	Curve effects	14
3.2.3	Superelevation	15
3.2.4	Cant deficiency	16
3.2.5	Cant excess	18
3.2.6	Maximum superelevation	19
3.2.7	Transition curves	19
3.2.8	Cross level transitions	22
3.2.9	Adjacent curves	24
3.3	Curve resistance	25
3.4	Gradients	25
3.4.1	Gradient resistance	25
3.4.2	Magnitude of gradient	25
3.4.3	Vertical transition curves	26
3.5	Guidelines for admissible quasi-static accelerations	27
4.	TRACK LOADS	29
4.1	General	29
4.2	Axle loads	30
4.3	Line classification	30
4.4	Speeds	31
4.5	Causes and nature of track loads	32
4.6	Vertical rail forces	33
4.7	Tilting risk	34
4.8	Lateral forces on the rail	34
4.9	Effects of combined Q/Y forces	35
4.10	Longitudinal forces	37
5.	TRACK STABILITY AND LONGITUDINAL FORCES	39
5.1	Introduction	39
5.2	Stability	40
5.2.1	General considerations	40

5.2.2	Finite element model	40
5.2.3	External joint loads	46
5.2.4	Continuous welded switches	49
5.3	Longitudinal forces	51
5.3.1	General considerations	51
5.3.2	Modelling of the longitudinal force problem	51
5.3.3	Examples of longitudinal force calculations	53
6.	TRACK DESIGN	59
6.1	Introduction	59
6.2	Calculation via beams on an elastic foundation	59
6.3	Rail stresses	65
6.3.1	Stresses in rail foot centre	65
6.3.2	Stresses in the rail head	68
6.3.3	Stresses due to a combined Q/Y load	71
6.4	Sleeper stresses	75
6.5	Stresses in ballast bed and formation	77
6.5.1	Vertical stresses on ballast bed	77
6.5.2	Vertical stresses on formation	78
6.5.3	Odemark's equivalence method	79
6.6	Influence of higher speeds and increased axle loads	82
6.6.1	Speed	82
6.6.2	Increase in axle loads	83
6.6.3	Stresses resulting from $Q = 170$ kN	88
6.7	Wheel flats	88
6.8	Forces due to bad welds	90
6.9	Axle box accelerations	92
7.	TRACK CONSTRUCTION	93
7.1	Introduction	93
7.2	Formation	94
7.3	Ballast bed	94
7.4	Rails	95
7.5	Rail joints and welds	98
7.6	Sleepers	104
7.7	Fastenings	110
7.8	Track systems	116
7.9	Switches and crossings	121
7.9.1	The standard turnout	121
7.9.2	Notations used for switches and crossings	126
7.9.3	Types of turnout and crossing	126
7.9.4	Crossovers	127
8.	THE RAIL	133
8.1	Introduction	133
8.2	Modern rail manufacturing	133
8.2.1	Blast furnace	133
8.2.2	Steelmaking	136
8.2.3	Vacuum degassing and argon flushing	137

8.2.4	Ingot casting	137
8.2.5	Continuous casting	138
8.2.6	Rolling mill	140
8.2.7	Finishing shop	143
8.2.8	Inspection and acceptance	145
8.2.9	Rail profiles	148
8.3	Rail properties	152
8.3.1	Metallurgical fundamentals	152
8.3.2	Heat treatment	154
8.3.3	Rail grades	156
8.3.4	Wear resistance	159
8.3.5	Fatigue strength	160
8.3.6	Fracture mechanics	161
8.4	Rail welding	167
8.4.1	Flash butt welding	167
8.4.2	Post-processing of flash butt welds in the NS welding depot	170
8.4.3	THERMIT welding	173
8.4.4	Cooling rates	178
8.4.5	Improvement of THERMIT weld geometry	180
8.4.6	Weld geometry standards	181
8.5	Rail failures	183
8.5.1	Defects in rail ends	183
8.5.2	Defects away from rail ends	185
8.5.3	Weld and resurfacing defects	195
8.5.4	Rail defect statistics	201
9.	TRACK MAINTENANCE AND RENEWAL	207
9.1	Introduction	207
9.2	General maintenance aspects	208
9.3	Manual method of track geometry improvement	209
9.4	Rail-grinding trains	211
9.5	Correcting weld geometry	215
9.5.1	STRAIT principle	215
9.5.2	Mobile weld correction	216
9.6	Tamping machines	217
9.6.1	General considerations	217
9.6.2	Tamping principle	218
9.6.3	Smoothing principle of modern tamping machines	221
9.6.4	DRIVER	224
9.6.5	GVA	225
9.7	Stone blowing	225
9.8	Design tamping	227
9.9	Ballast stabilizer	229
9.10	Ballast cleaner	229
9.11	High temperatures	230
9.12	Maintenance of track structure	231
9.13	General observations on track renewal	232

9.14	Manual track renewal	232
9.15	Mechanical track renewal	233
9.15.1	Introduction	233
9.15.2	Track possession	234
9.15.3	Gantry crane method	234
9.15.4	Track section method	235
9.15.5	Continuous method	236
9.15.6	Track renewal trains	243
9.16	Switch renewal	244
9.17	Track laying	245
9.17.1	General considerations	245
9.17.2	Track construction trains	245
9.17.3	Platow system	246
9.17.4	TGV France	246
10.	DETERIORATION OF TRACK GEOMETRY	249
10.1	Introduction	249
10.2	Historical records	249
10.3	Factors influencing the deterioration of track geometry	251
10.4	Deterioration rates of geometry	253
10.5	Effect of tamping	255
10.6	Effect of weld straightening	256
10.7	Development of corrugations	258
10.8	Effect of stone blowing	258
10.9	Development of lateral track resistance	259
11.	ULTRASONIC RAIL INSPECTION	263
11.1	Introduction	263
11.2	The NS ultrasonic train	264
11.2.1	Description of the ultrasonic train	264
11.2.2	Probe system	265
11.2.3	Detection area	266
11.2.4	Analog electronics	268
11.2.5	Incident detection	268
11.2.6	Hardware	270
11.2.7	On-line representation	271
11.2.8	Off-line data analysis	273
11.2.9	Extension of detection possibilities	275
11.3	NS ultrasonic inspection programme	276
12.	RECORDING SYSTEMS	277
12.1	Introduction	277
12.2	Some aspects of geometry recording	278
12.3	The NS track recording system BMS	280
12.4	Recording of vertical rail and weld geometry using BMS-2	281
12.4.1	Measuring principle	281
12.4.2	Estimation of transfer function	282
12.4.3	Structure of BMS-2	284
12.4.4	Data analysis	287

12.5	Recording of track geometry according to BMS-1	288
12.5.1	Selecting the measuring system	288
12.5.2	Measuring principle	288
12.5.3	Dynamic signals	290
12.5.4	Quasi-static signals	294
12.5.5	Signal combination for determining track parameters	296
12.5.6	Instrumentation	299
12.5.7	Signal analysis	301
12.6	Vehicle response analysis according to VRA	309
12.6.1	Introduction	309
12.6.2	Principle of calculation	310
12.7	Results from BMS campaigns	311
12.7.1	NS distribution functions	311
12.7.2	Results from the ORE D 161 Europe Tour	313
12.7.3	Comparison between BMS and Mauzin	313
12.7.4	Track geometry spectra	316
13.	COMPUTER AIDED TRACK MAINTENANCE AND	
	RENEWAL	317
13.1	Philosophy	317
13.2	Basic data for predicting and planning	318
13.2.1	Track geometry	318
13.2.2	Rail failures	321
13.2.3	Ballast	322
13.2.4	Sleepers and fastenings	323
13.2.5	Management information	324
13.3	The NS BINCO system	325
13.3.1	Basic concept	325
13.3.2	Quality classes	327
13.3.3	Quality index versus standard deviation according to NS	327
13.3.4	Normalized standard deviations and peak values	329
13.3.5	Tamping	330
13.3.6	Grinding	335
13.3.7	Lateral rail wear	336
13.3.8	Rail fatigue	339
13.3.9	Predicting accumulated tonnage growth for different renewal strategies	342
13.3.10	Examples of data per MAINS as a function of time	342
14.	RAILWAY-INDUCED GROUND VIBRATIONS AND	
	NOISE	345
14.1	Introduction	345
14.2	Some definitions	345
14.3	Ground vibrations	347
14.3.1	Introduction	347
14.3.2	Wave propagation in soils	348
14.3.3	Human perception	353
14.3.4	Measured vibrations	356

14.3.5	Vibration reduction	357
14.3.6	Measures for ballasted tracks	359
14.3.7	Measures for slab tracks	360
14.3.8	Measures for tracks in the open	365
14.4	Railway noise	366
15.	ASSESSMENT OF TRACK QUALITY THROUGH VEHICLE RESPONSE	369
15.1	Introduction	369
15.2	Track modelling	371
15.2.1	General considerations	371
15.2.2	Critical speed	371
15.2.3	Transfer function between track load and track displacement	372
15.3	Vertical wheel response	377
15.3.1	Hertzian contact spring	377
15.3.2	Transfer functions between wheel and rail	377
15.4	Linear vehicle model	381
15.4.1	Schematization	381
15.4.2	Response to irregularities in level	381
15.4.3	Combination of level results	384
15.4.4	Response to irregularities in alignment	385
15.4.5	Response to irregularities in cant	386
15.4.6	Combination of cant results	387
15.4.7	ISO weighting of car body accelerations	389
15.4.8	Calculated transfer functions for the NS measuring coach	391
15.5	Estimation of transfer functions from measured data	394
15.5.1	General concept	394
15.5.2	Basic principles for 1 input and 1 output	394
15.5.3	Multiple input, single output (MISO)	398
15.5.4	Statistical reliability	399
15.5.5	Numerical aspects	401
15.5.6	Applications	404
15.5.7	Comparison between transfer functions estimated by MISO and calculated with models	412
15.6	Vehicle response analysis in real time	414
15.7	Comparison between W _z -weighted and ISO-weighted accelerations	417
16.	HIGH-SPEED TRACKS	421
16.1	Vehicle reactions	421
16.2	Track geometry	421
16.3	Rail geometry and weld geometry	424
16.4	Track quality standards for 300 km/h	424
16.4.1	Rail geometry	425
16.4.2	Vehicle reactions	425
16.4.3	Track geometry	427
16.4.4	Interpretation of standards	427
16.4.5	Requirements for checking track geometry	429
