

## Pricing kilometres in The Netherlands

- ▶ Prof. Dr. Henk Meurs
  - ▷ Radboud Universiteit Nijmegen/
  - ▷ MuConsult Amersfoort

## Objective: Share the intended Dutch approach to pricing road transport

- ▶ Content
  - ▶ Introduction
  - ▶ Current tax system
  - ▶ History of road pricing in the Netherlands
  - ▶ Characteristics of the system proposed
  - ▶ Effects on car fleet, mobility, emissions and revenues
  - ▶ Acceptance of the measures by the Dutch population;
  - ▶ Current state of affairs;
  - ▶ Conclusions
- ▶ Limitation to transport of persons; no attention to freight

## Current tax system cars

- ▶ Purchase tax on new cars (BPM):
  - ▶ 2008: 25% of new price of cars
  - ▶ Revenues: euro 3.4 billion annually
- ▶ Vehicle ownership tax (average Euro 630 per year)
  - ▶ yearly tax on ownership with regional surcharge
  - ▶ Variation by weight, fuel type, province
  - ▶ Revenues: euro 4.0 billion (including 1.1 billion reg. surcharge)
- ▶ Fuel taxes (excluded from km-price system)
  - ▶ Revenues 6.9 billion
  - ▶ Gasoline/LPG taxes mild
- ▶ Major revision in 2009 (up to 2012):
  - ▶ Purchase taxes based on emissions (CO<sub>2</sub>, etc)
  - ▶ Small shift from purchase taxes to ownership taxes

## Consequences current tax system

- ▶ Taxes to large extent based on ownership of cars
- ▶ Overconsumption of car kilometres
- ▶ Car use causes main problems:
  - ▶ Congestion
  - ▶ Safety
  - ▶ Pollution
- ▶ Equity issues:
  - ▶ Heavy users pay too little
  - ▶ Small users too much
- ▶ Hence shift in tax system necessary:
  - ▶ Pay different for mobility
  - ▶ Pricing of kilometres rather than ownership

## History of road pricing in The Netherlands

- Previous attempts:
  - 1988: Road Pricing I
  - 1992: Rush-Hour disc
  - 1994: Road pricing II
  - 1999: Rush-hour surcharge and road pricing in the form of tollbooths on all access and exit roads of the four major cities in the Randstad conurbation (road pricing)
  - 2001: convert fixed government charges to a payment per kilometre by no later than 2006
  - 2005 till now: Kilometre charge

## Crucial step: Nouwen committee (2004)

- ▶ Participants:
  - ▶ Regional and local authorities
  - ▶ CEO's private sector
  - ▶ Major pressure groups
    - ▶ Economic, environmental, motorists, etc
- ▶ Study of 10 pricing alternatives
- ▶ Result:
  - ▶ Joint proposal for main characteristics of system
  - ▶ Formulation of preconditions eg:
    - ▶ No increase in revenues
    - ▶ Revenues to infra budget
    - ▶ No excessive administrative costs
    - ▶ Privacy guaranteed
    - ▶ Support in society

## Major alternatives investigated by Nouwen

|  | Decrease travel time loss (hours) | Environment and safety | Costs (Investments) | Introduction     | Welfare (Euro, billions) |
|--|-----------------------------------|------------------------|---------------------|------------------|--------------------------|
| <b>1</b><br>Congestion charge at busy times and places | Up to 55%                         | Tot 3%                 | 200 mio             | 2009-2011        | 1,3                      |
| <b>2</b><br>Fixed charges per kilometre                | Up to 40%                         | Tot 10%                | 3 miljard           | 2011-2016        | 1                        |
| <b>3</b><br>Toolbooths (6 places)                      | Ca. 15%                           | Ca. 0%                 | 100 mio             | 2009 and further | Ca. 0                    |
| <b>4</b><br>Fuel tax increase                          | Ca. 15%                           | Up to 10%              | 0                   | 2006             | 2,4                      |

## Proposals Nouwen and subsequent joint fact finding

- ▶ Charge kilometres driven with cars with base price;
- ▶ Surcharge on congested roads
- ▶ Vary price by type of car:
  - ▶ Environmental characteristics
- ▶ Introduce system over period of time (eg 6 years):
  - ▶ Limited capacity wrt installation
  - No distortion of car market

### Political discussions:

- ▶ Multiple objectives (congestion, environment and support)
- ▶ Relate price to emissions (CO<sub>2</sub>, etc)
- ▶ Replacement of all ownership taxes vs partial reduction
- ▶ Costs of system (< 5% of revenues)

## Price per kilometer

- ▶ An average price of 6.7 cents per kilometer.
- ▶ Differentiation based on:
  - ▶ CO<sub>2</sub>
  - ▶ Fuel type
  - ▶ Particle filters (diesel)
- ▶ Dispersion according to the existing road taxes and purchase taxes.

**The Washington Post**  
**LaHood Talks of Mileage-Based Tax**  
 White House Dismisses Controversial Idea to Fund Transportation Projects

**Der Spiegel**  
**ROAD PRICING IN THE NETHERLANDS**  
*The toll that makes everyone happy*

## Kilometre charge: base price levels

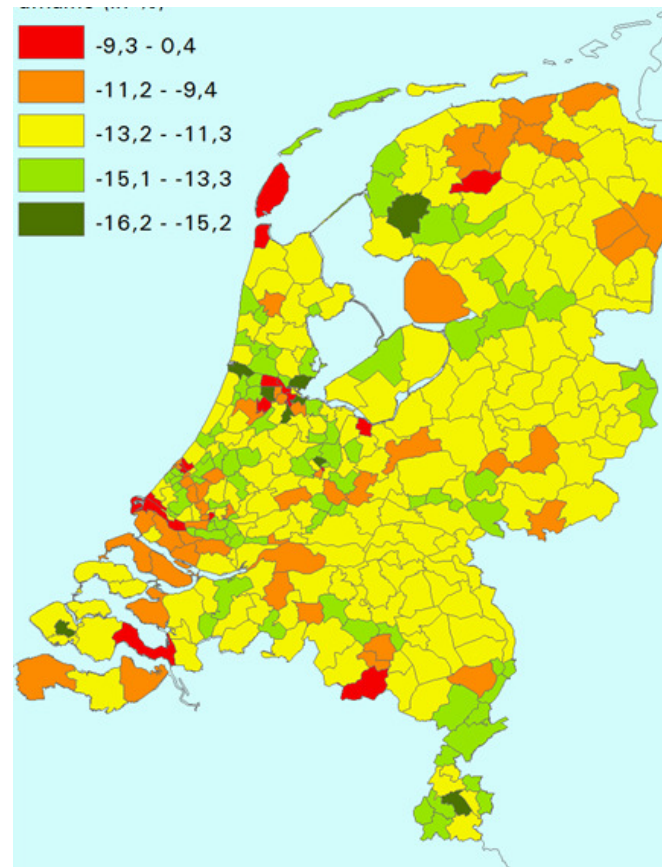

## Forecasting effects

- ▶ Mobility:
  - ▶ Number of kilometres driven: -12-15%
  - ▶ Travel time losses: - 40-60%
  - ▶ Kilometres on public transport: + 6%
  
- ▶ Environmental:
  - ▶ CO<sub>2</sub> : -10%
  - ▶ Particulate matter: - 10%
  - ▶ NOx : - 19%
  
- ▶ Other:
  - ▶ Traffic safety: + 7%
  - ▶ Car fleet: +2-3%

## Regional differences limited eg urban/rural

Two alternatives price systems: selected vs environmental optimized

*Effect of two alternatives (2030):*

|                                  | Reference | Kilometre Charge |          |
|----------------------------------|-----------|------------------|----------|
|                                  | Tax plan  | Government       | S-Curve  |
| 2020                             |           |                  |          |
| Total milage (x10 <sup>9</sup> ) | 130       | 114              | 115      |
| Average CO <sub>2</sub> /km      | 158       | 160              | 158      |
| Total CO <sub>2</sub> (MegaTon)  | 20,8      | 18,6             | 18,5     |
|                                  |           | (-10,5%)         | (-11,1%) |
| 2030                             |           |                  |          |
| Total milage (x10 <sup>9</sup> ) | 144       | 126              | 128      |
| Average CO <sub>2</sub> /km      | 142       | 146              | 144      |
| Total CO <sub>2</sub> (MegaTon)  | 20,6      | 18,8             | 18,6     |
|                                  |           | (-8,7%)          | (-9,7%)  |

- ▶ S-curve compared to government proposal:
  - ▷ More effective on average and total CO<sub>2</sub> (cleaner cars have lower charge, dirty cars higher)
  - ▷ Less effective on total kilometers (lower charge for more cars means less reduction in milage)

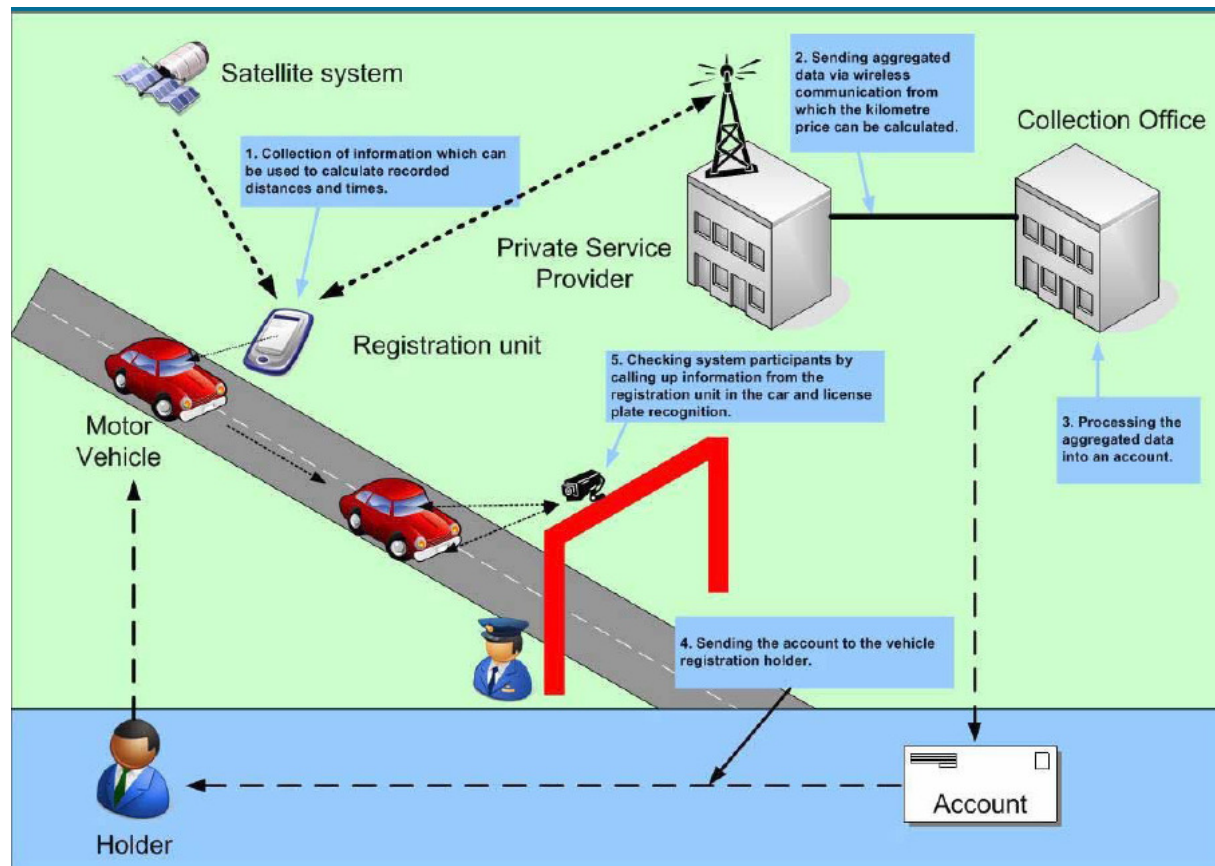

## The system characteristics

- ▶ Major technical characteristics:
  - ▶ OBU using satellite technology mandatory
  - ▶ Start with GPS; then Galileo
- ▶ Two tracks:
  - ▶ Private service providers
    - ▶ Competition between suppliers
    - ▶ End to end, including all services ?
    - ▶ Optional Value added services
      - ▶ Travel information
      - ▶ Assurance services
  - ▶ Public track
    - ▶ Limited services
    - ▶ Back up for private market failure
    - ▶ Transition period

## Communication aspects with GPS and GSM

## Major implementation issues

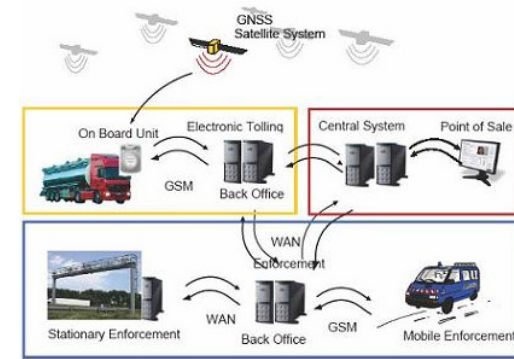

- ▶ Privacy:
  - ▶ Public track:
    - ▶ Smart On board unit: calculates and communicates trip totals
    - ▶ Once a week sends totals to collection office
  - ▶ Private track:
    - ▶ If users permits more information (value added services)
    - ▶ Totals to collection office
- ▶ Enforcement:
  - ▶ Trusted Element (compare SIM-card on mobile)
  - ▶ Register interruptions and check
  - ▶ Mobile and fixed checks
- ▶ System failure:
  - ▶ Repair obligation within weeks
  - ▶ Estimation of kilometres driven
  - ▶ Owner checks registration on PC

## Costs

- ▶ Condition of parliament: operational costs less than 5% and investments costs as low as possible
- ▶ Outcome:
  - ▶ Implementation 3.8 billion (Incl. project costs)
  - ▶ Exploitation 1.8 billion (during scaling-up period)
  - ▶ Total (u/t 2018) 5.6 billion, including 1.4 billion risks
- ▶ Main start up cost drivers for government:
  - ▶ Unit Price OBE
  - ▶ Installation time per vehicle
  - ▶ 9 mio vehicles

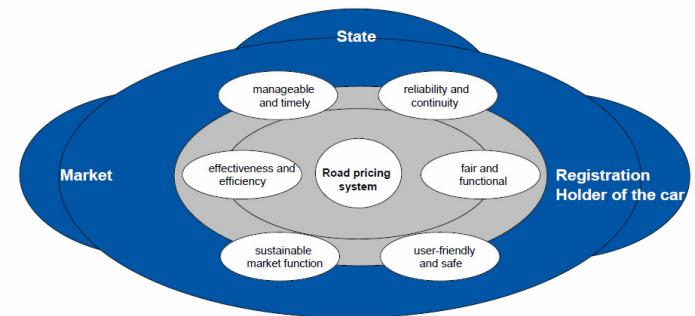

## Mobility projects 2009-2012

- ▶ Mobility projects in six urban regions aimed at:
  - ▽ deal with traffic jams in the short term (decrease number of car kilometres in rush hours by a minimum of 5%).
  - ▽ make motorists and employers more aware of possible options (telecommuting, public transport, earlier/later working hours).
  - ▽ assess motorist behaviour.
  - ▽ provide operational experience with the new technology (including satellite technology).
  - ▽ give the commercial sector the opportunity to gain experience with the system.
- ▶ Use GPS/GSM systems and pay users to avoid peak hours/routes
- ▶ 2000-10.000 participants differing by region

## Public acceptability

- ▶ Conditions of Nouwen committee are met eg:
  - ▶ Revenues to infra fund (roads and public transport)
  - ▶ Privacy and enforcement issues
  - ▶ Operational costs < 5% (expected)
- ▶ Public support measured by Motorist organization:
  - ▶ 68% supports principles
  - ▶ **But**
    - ▶ No peak hour surcharge
      - ▶ Alternatives to car usage in peak?
    - ▶ Technical system:
      - ▶ Privacy
      - ▶ Security of information
      - ▶ Technical failures
- ▶ Communication and demonstration important

## Current state of affairs

- ▶ Government fell in March, new elections in June
- ▶ Stop further developments until new government is installed
- ▶ Right wing and socialist parties oppose system
- ▶ Center/center-left supports system
- ▶ Mobility projects continued
