

Techniques of Transport Planning

John R. Meyer, Editor

VOLUME ONE

Pricing and Project Evaluation

JOHN R. MEYER *and* MAHLON R. STRASZHEIM

*With special contributions by Benjamin I. Cohen,
Leon M. Cole, John F. Kain, Koichi Mera, Robert Mnookin,
Paul O. Roberts, & Martin Wohl*

The Brookings Institution

TRANSPORT RESEARCH PROGRAM

Washington, D.C.

Contents

1. The Transportation Planning Problem	1
Systems versus Project Analysis	2
Planning in a Project Context	4
PART ONE: Pricing Principles and Their Implications	
2. Alternative Pricing Strategies <i>with Martin Wohl</i>	11
Conventional Practice: Monopolistic Price Discrimination and Average Cost Pricing	13
Marginal Cost Pricing	15
Prices Based on User-Cost Estimates	17
Complex Differentiated Pricing Schemes	20
Options, Superpeaks, and Eclectic Pricing Strategies	23
Summary	27
3. Cost Concepts	30
The Structure of Accounting Costs	31
Problems Associated with Common Costs	34
Defining Marginal and Fixed Costs	35
Cost Concepts and Statistical Estimation	39
Summary	43
4. Congestion Cost and Transport Pricing <i>with Martin Wohl</i>	44
Short-Run Allocative Costs	45
Consumer Choice and Effects on Income Distribution	52
Adjustments to Congestion in the Long Run	55
Summary	58

5. Problems of Resource Allocation in a Context of
Second Best 60
with Robert Mnookin
A Basic Model of Welfare Maximization in a Static Context 61
Market Imperfections: Distortion Parameters 66
The Explicit Model 69
Perfect Competition 72
Factor Market Imperfections 73
Product Market Imperfections 75
Production Parameters 76
Different Utility Weights 77
Conclusion 79
6. Criteria for Evaluating Alternative Pricing Strategies 80
Distributive Effects 81
Location Consequences 82
Inflation, Technological Change, and Macroeconomic Policy 84
Miscellaneous Practical Considerations 87
Evaluation 88
Summary 95
- PART TWO: Forecasting the Demand for
Transportation**
7. Transport Demands: The Basic Framework 99
Land-Use or Economic Location Patterns 101
Trip Generation 103
Zonal Interchange or Distribution 104
Modal Choice 106
Route Assignment 107
Summary 108
8. Forecasting Urban Passenger Travel 110
with John F. Kain
Land-Use Models 110
Trip Generation 113
Peak-Hour Characteristics of Trip Generation 115
Interzonal Flow Models 117
Modal Choice 123
Network Assignment 133
Land-Use Feedbacks and the Need for Simulation Models 134
9. Modeling Intercity Passenger Demand 137
with John F. Kain
The Gravity Formulation and Its Basic Extensions 138

Abstract Mode Models	144	
Cross-Section Studies of Air Travel	151	
Time-Series Models of Air Travel and More Sophisticated Pooling Techniques	153	
Generalizations about Modal Choice	161	
10. Forecasting Demands for Intercity Freight Transport		165
Estimating Traffic Generation	165	
Interzonal Flow Models	167	
Modal Choice	170	
Concluding Observations	177	
PART THREE: Project Evaluation		
11. Benefit Measurement for Transport Projects		185
The Dimensions of Social Benefits	186	
Benefit Measurement in a Conventional Welfare Context	187	
Transport Benefit Measures in Practice	192	
Social and External Effects	199	
Summary	202	
12. Discounting Benefits and Costs		204
<i>with Benjamin I. Cohen</i>		
The Market Rate of Interest in the Context of Perfect Capital Markets	206	
The Case for a Social Rate of Discount below Market Rates	208	
The Public Sector's Role in Capital Markets and Its Opportunity Cost	210	
Concluding Observations	213	
13. Uncertainty and Facility Design		216
<i>with Leon M. Cole</i>		
The Conventional Treatment of Uncertainty	217	
An Introduction to Decision Theory	219	
Application to Facility Design	222	
Time Staging Considerations	225	
Conclusion	227	
14. Individual Project Evaluation: An Outline of a Decision Procedure		228
Pricing Procedures: Objectives, Feasibility, and Acceptability	229	
A Transport Project Pricing and Evaluation Procedure	232	
An Example of Project Evaluation in a Context of Price Differentiation, Cyclic and Temporal	237	
Summary	246	

**PART FOUR: *Project Interdependencies
and Programming Techniques—
an Introduction to System Planning***

15. Selecting and Staging Additions to a Transport Network 251
by Paul O. Roberts
Network Planning as an Integer Programming Problem 252
A Multitime Period Staging Formulation 257
An Illustrative Application 261
Summary and Critique 269
16. Investment Planning with Capital Budget Constraints 276
Maximizing Expected Net Benefits: Linear Programming Models 278
Maximizing Benefits under Risk Averse Preferences: Quadratic Programming 283
Implications of the Programming Approach 291

APPENDIXES

- A. An Evaluation of Gravity and Linear Programming Transportation Models for Predicting Interregional Commodity Flows 297
by Koichi Mera
- B. Time Discounting Procedures for Capital Budgeting 309
by Leon M. Cole
